

Take control of email signatures in Microsoft 365

Gain consistency, compliance, and control in minutes—no IT headaches, no workarounds.

Every email your employees send is a reflection of your brand. But Microsoft 365's native tools can't centrally manage email signatures at scale—especially across hybrid environments, mobile devices, and remote teams.

Exclaimer for Microsoft 365 gives you centralized control of every signature. Sync data from Azure Active Directory, apply consistent branding and disclaimers, and push updates automatically—no scripts, no manual fixes, no user errors.

Native Microsoft tools fall short

Email signatures are often the first impression prospects and clients get of your brand—it's important to get them right. But Microsoft 365 has limited ability to manage signatures at scale.

Without centralized control, you risk:

- **Transport rules and PowerShell:** Creating and updating signatures means using mail flow rules or scripts, which are error-prone and hard to scale.
- **No consistent placement:** Signatures are added at the bottom of email threads, not directly under the latest reply.
- **Limited mobile and web coverage:** Client-side signatures don't apply on mobile or webmail unless configured individually.
- **Lack of visibility:** You can't preview signatures before rollout, making it harder to catch errors.
- **No role-based delegation:** IT owns every change—even when other teams need updates.

Microsoft 365 handles email. Exclaimer handles everything signatures should be.

Centralized signature management for Microsoft 365

Exclaimer gives IT teams full control over how email signatures are created, applied, and updated in Microsoft 365—without touching user devices or mail flow rules.

Key features & benefits:

- **Centrally manage signatures** across Outlook, mobile, and web from one cloud-based dashboard
- **Sync user data** from Azure AD and keep details up-to-date automatically.
- **Apply consistent**, branded signatures organization-wide—without relying on end users.
- **Enforce legal disclaimers** and track changes to support audit-readiness
- **Support dynamic signature** layouts based on user role, recipient type, and more
- **Delegate permissions** to other teams with role-based access controls

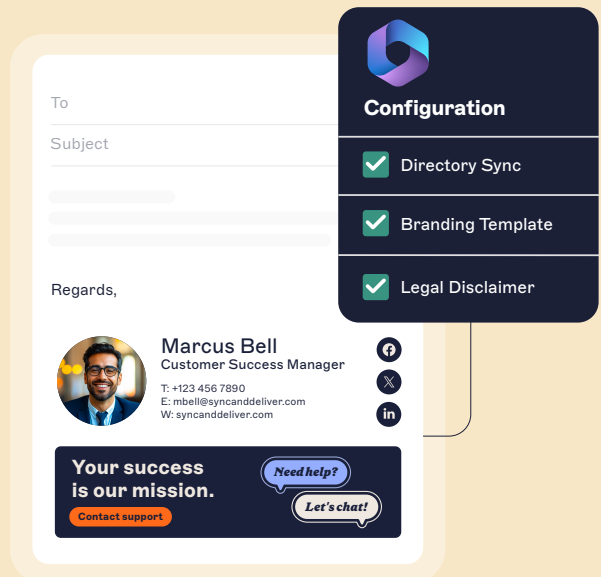

“[Exclaimer’s] integration with Microsoft 365 and Google Workspace makes deployment seamless, and the intuitive interface allows IT and marketing teams to collaborate effectively without relying heavily on technical resources.”

— G2 User

Try it today and see the difference

1. **Connect to Microsoft 365 and sync Azure Active Directory.**
2. **Choose a signature template or build one from scratch.**
3. **Set rules to dynamically adjust email signatures by team, domain, device, and more.**
4. **Deploy Exclaimer across your organization with a single click.**

More than 70,000 global organizations trust Exclaimer to keep their email signatures consistent, compliant, and under control.
